

CSS Flex

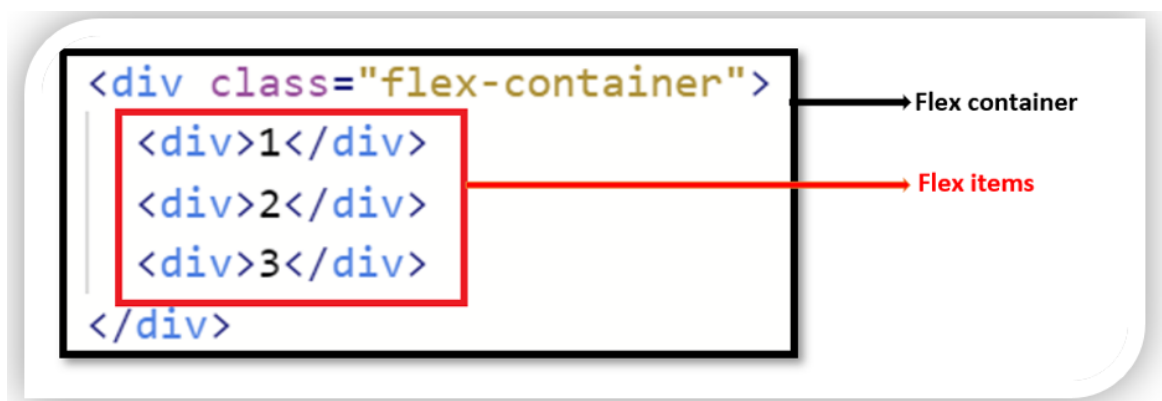

Topics Covered:

1. What is Flexbox?
2. Uses of Flexbox.
3. Important terminologies.
4. Flex properties.
 - a. Flex container properties.
 - b. Flex item properties.

Topics in Detail:

Flexbox:

- Flexbox is a one-dimensional layout model, where flex means flexible length on flexible items.
- The flexbox layout must have a **parent element(container)** with the **display** property "**flex**". So that the child elements of the container automatically become **flex items**.

- Flexbox provides an easy way to arrange items within a container.
- Flexbox **aligns and distributes space** among the items in the container even when the size of the items is unknown or dynamic.
- Flexbox expands/shrinks to fill available space/prevent overflow and distributes space among the items.
- Flexbox is used for creating small-scale layouts.
- Flexbox aligns the items vertically and horizontally using rows and columns.

Flexbox uses:

- The flexbox makes the website/web app behave in a similar manner even when they are viewed on different devices that have different screen sizes.
- To create responsive and mobile-friendly websites/web apps flexbox can be used.

Important terminologies:

- The two main components of flexbox are flex container and flex item.
 - **Flex container:** Property of parent element that is declared with display property flex.
- **Flex item:** Properties of child elements. There may be one or many flex items.
- Flex layout is based on **flex-flow directions**, which are used in displaying the flex items. Flexbox has two axes.
 - **Main axis:** The primary axis along with the flex items are laid out.
 - **Cross axis:** The axis perpendicular to main axis is called cross axis.

```
.flex-container {  
  display: flex;  
}
```

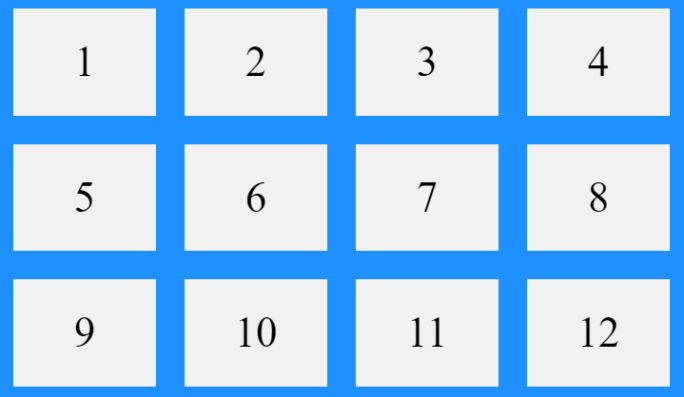

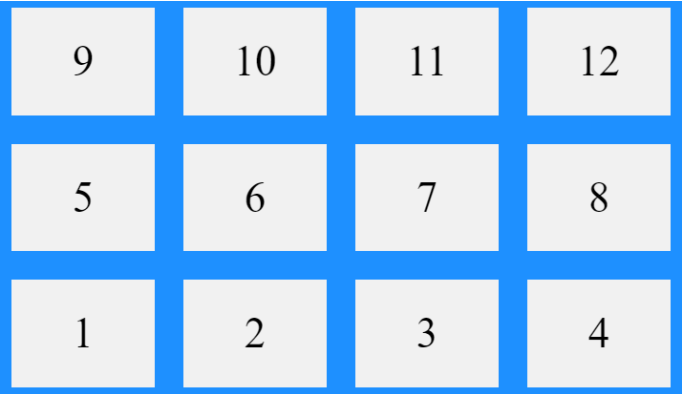

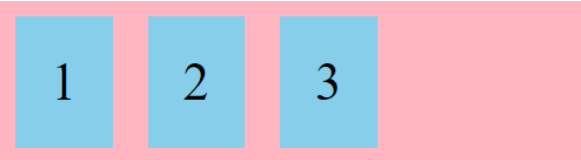

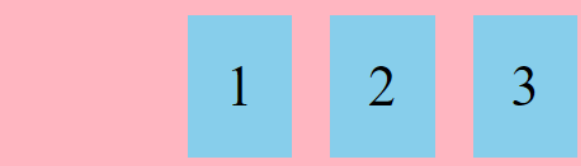

NOTE: It is not necessary that the main axis should always be horizontal, it depends on the **flex-direction** property. The main axis and cross axis are perpendicular to each other.

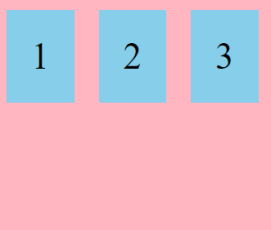

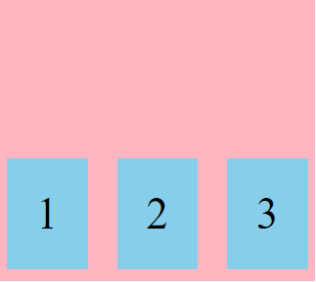

Flex properties:

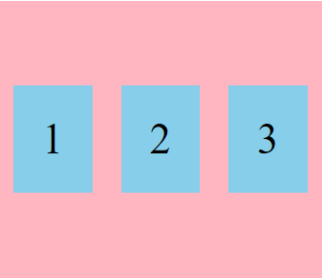

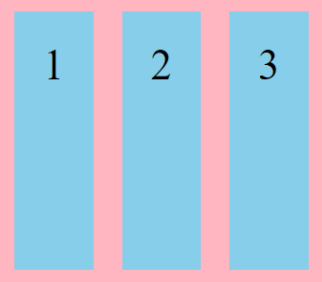

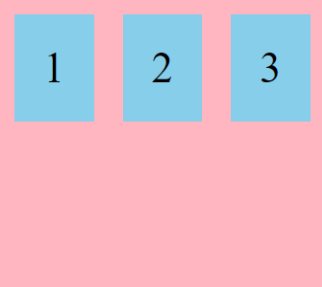

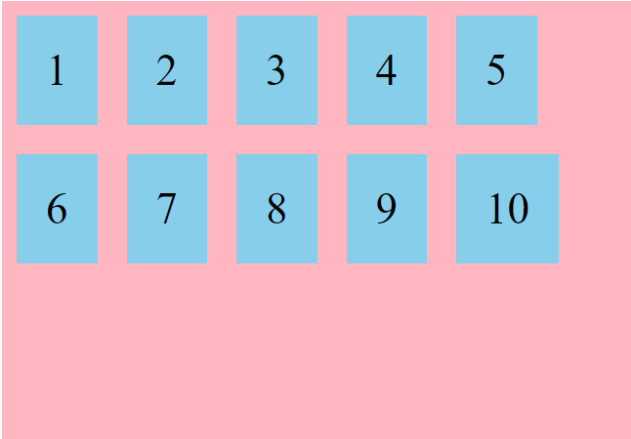

Flex container properties:

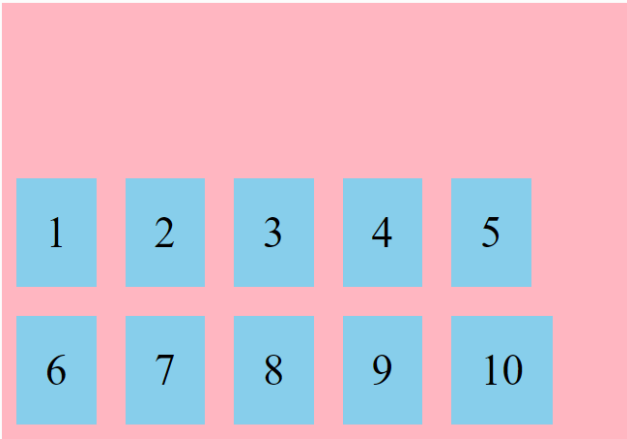

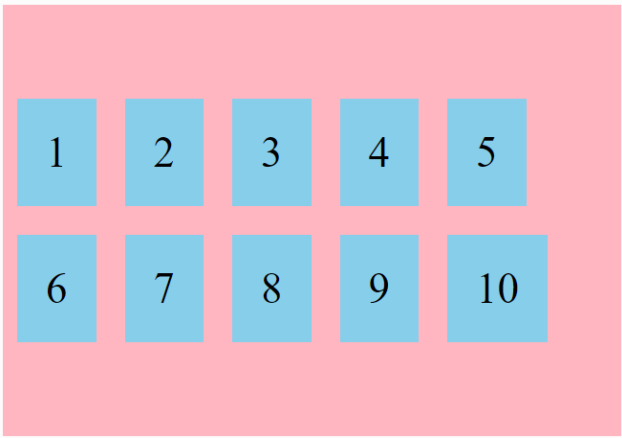

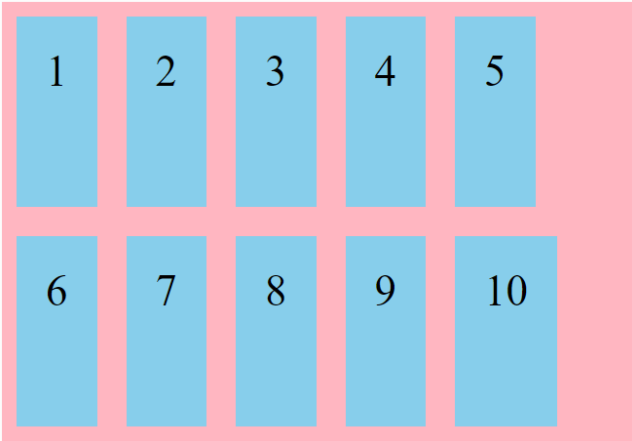

Property	Value and Description	
display	flex	Enables flex context to all direct children of the container. <code>display: flex;</code>
flex-direction	Specifies the direction of flex items in the main axis.	
flex-direction	row	Default value, left to right.  Flex items
flex-direction	row-reverse	Right to left.  Flex items
flex-direction	column	Top to bottom. Flex items 

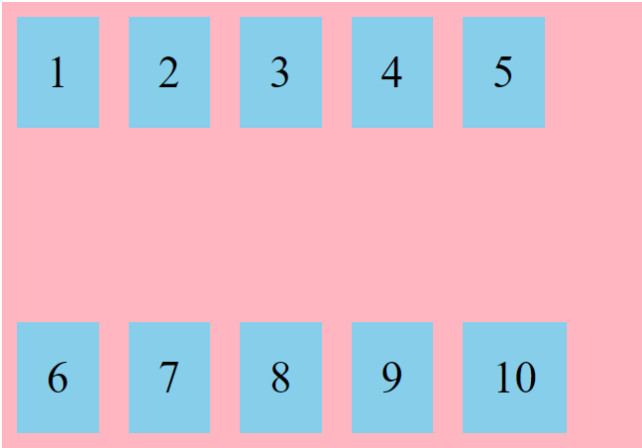

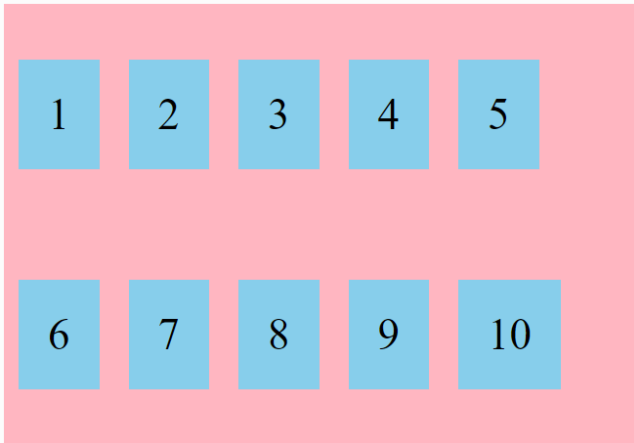

Property	Value and Description	
flex-direction	column-reverse	<p>Bottom to top.</p> <p>Flex items</p> 
flex-wrap	Specifies whether the flex items should wrap or not when there is no enough space in a line.	
flex-wrap	nowrap	<p>Wrapping will not happen, all flex items will be in one line.</p> 
flex-wrap	wrap	<p>Flex items will be wrapped in multiple lines depending on the number of items from top to bottom.</p> 
flex-wrap	wrap-reverse	<p>Flex items will be wrapped in multiple lines depending on the number of items from bottom to top.</p>

		
Property	Value and Description	
flex-flow	<p>Shorthand property for flex-direction and flex-wrap.</p> <p>flex-flow: row wrap-reverse;</p> <p>row → Flex direction wrap-reverse → Flex wrap</p>	
justify-content	To align flex items on the main axis.	
justify-content	flex-start	<p>Default value. Flex items will be packed towards the start of the flex-direction.</p> 
justify-content	flex-end	<p>Flex items will be packed towards the end of the flex-direction.</p> 
justify-content	center	<p>Flex items will be centered along the container line.</p> 
justify-content	space-between	Flex items will be evenly distributed along the container line.

		
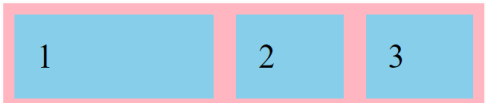

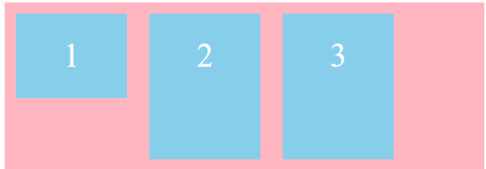

justify-content	space-around	<p>Flex items will be evenly distributed along the container line with equal space around them.</p> 
Property	Value and Description	
justify-content	space-evenly	<p>Flex items will be evenly distributed along the container line. The space between all the items and items to edges are even.</p> 
align-items	To align the flex items on the cross axis.	
align-items	flex-start	<p>Flex items will be placed in the start of the cross axis.</p> 
align-items	flex-end	<p>Flex items will be placed at the end of the cross axis.</p> 
align-items	center	<p>Flex items will be placed in the center of the cross axis.</p>

		
align-items	stretch	<p>All flex items will be aligned in the same space in cross axis by stretching the container.</p> 
Property	Value and Description	
align-items	baseline	<p>Baseline of the flex items will be aligned.</p> 
align-content	<p>To align the flex lines. It will be effective only on multi-line flex containers where the flex-wrap property is either wrap or wrap-reverse. Similar to align-items but here the flex lines are aligned.</p>	
align-content	flex-start	

align-content	flex-end	
Property	Value and Description	
align-content	center	
align-content	stretch	

align-content	space-between	
Property	Value and Description	
align-content	space-around	
gap	<p>To control space between flex items.</p> <p>gap: 10px 20px;</p> <p> ↓ Row gap ↓ Column gap </p>	

Flex item properties:

Property	Value	Description
order	Value must be a number. Default value is 0. <pre><div style="order: 2"> to</div> <div style="order: 3">CSS Flex</div> <div style="order: 1">Welcome</div></pre>	Specifies the order of flex items. 
flex-grow	Value must be a number. Default value is 0. <pre><div style="flex-grow: 3">1</div> <div style="flex-grow: 1">2</div> <div style="flex-grow: 1">3</div></pre>	To make the flex item grow with respect to given value. 
flex-shrink	Value must be a number. Default value is 1. If the value is given as 0, it won't let the flex item shrink. <pre><div style="flex-shrink: 8">1</div> <div style="flex-grow: 1">2</div> <div style="flex-grow: 1">3</div></pre>	To make the flex item shrink with respect to given value. 
Property	Value	Description
flex-basis	Length (px, %, rem, etc...) <pre><div style="flex-basis: 200px">1</div> <div>2</div> <div>3</div></pre>	The value will be assigned as the default size of the flex item and the remaining space will be distributed. 
flex	Shorthand property for flex-grow, flex-shrink, flex-basis. <pre><div>1</div> <div style="flex: 0 8 0px">2</div> <div>3</div></pre>	
align-self	Specifies the alignment for selected flex items inside the container.	
align-self	flex-start <pre><div style="align-self: flex-start">1</div> <div>2</div> <div>3</div></pre>	

align-self	flex-end <pre><div style="align-self: flex-end">1</div> <div>2</div> <div>3</div></pre>	
align-self	center <pre><div style="align-self: center">1</div> <div>2</div> <div>3</div></pre>	
align-self	baseline <pre><div style="align-self: baseline">1</div> <div>2</div> <div>3</div></pre>	
align-self	stretch <pre><div style="align-self: stretch">1</div> <div>2</div> <div>3</div></pre>
